#### PRELIMINARY AUTOPSY REPORT

#### Gross Examination:

A 26-year-old, 2.6 kg, brown and white, hysterectomized, female, capuchin monkey is examined at 2:30 pm on February 19th, 2016. The patient arrested under anesthesia and was euthanized the previous day and exhibits mild autolysis. The patient has a body condition score of 3/9 and exhibits moderate generalized muscle wasting. Oral muscosa is pale and the patient is missing all dentition. There is mild hypotrichosis of the ventrum and marked dorsal pelvic alopecia with a 1.5 x 1 cm, raised crust just caudal to the pelvis on midline.

The abdominal cavity contains 12 ml of dark serosanguineous to hemorrhagic fluid with blood clots in the mesentery overlying the liver. The right kidney weighs 9 g and displays a 5 x 6 mm, circular, dark red to black, depressed area on the capsule that extends into the cortex. The left kidney weighs 8 g and contains several, up to 3 mm, circular, cortical cysts. The spleen appears diffusely enlarged and weighs 33 g. The liver weighs 151 g (5.8% of body weight) and is slightly pale. Intestinal contents are pale tan and mucoid. The bladder is moderately distended with clear, straw-colored urine. The uterine stump, composed of cervix and small portion of the uterine body is located between the urinary bladder and distal colon/rectum, and appears otherwise unremarkable. The colon appears grossly normal and contains semi-formed stool. Both ovaries are present,

The pericardial suc contains 3 ml of clear, pink, serous fluid. The heart weighs 14 g. The left ventricular free wall measures 7 mm, the right ventricular free wall measures 1.5 mm, and the interventricular septum measures 7 mm in thickness. The brain is grossly normal and weighs 76 g.

The ventral surface of the lumbar vertebrae are multifocally irregularly thickened.

#### Summary of Gross Findings:

- 1. Body as a whole: moderate, diffuse muscle wasting
- Liver, spleen: moderate, diffuse, hepatosplenomegaly, suspect lymphoma
   Kidney: multiple cortical cysts in left kidney, focal hematoma in right kidney
- 4. Lumbar vertebrae: moderate, multifocal, spondylosis deformans, moderate, incidental

10% full Using 3.2 G A clear cause of the patient's arrest is not apparent. The enlarged liver and spleen is suspicious for lymphoma. The structure at the location of the uterine stump is grossly of uncertain significance. Histology is pending.

Helping Hands, a national not-for-profit corporation, breeds, raises, and trains capachin monkeys to assist severely disabled individuals with their doily activities. We are committed to providing the highest quality of life for each monkey and his or her companion during their many years together. Close monitoring of our monkeys' behavioral, nutritional, and veterinary needs has also enabled us to contribute to the welfare of capachin mankeys everywhere. Helping Hands also afters an educational program for schools, camps and youth organizations that teaches children about spinal cord injury prevention, dishility awareness and the human animal bond. Relying primarity on private contributions, Helping Hands provides these affectionate, responsive companions and life-time support free of charge. Helping Hands is an affiliate of Boston University School of Medicine.

Dear Betty,

diagnosis of illnesses

We are currently updating each monkey's medical record and would like to be sure that our health information on your monkey is both complete and up to date. We have noted the information that currently is in your monkey's file at this time. We would appreciate your assistance in verifying that this information is current and in providing the requested information for any of the following procedures that your monkey may have undergone (and that we currently do not have in your monkey's file). Please also note details of any additional surgical procedures, tests, illnesses or injuries that are not specified below. Additional paper or copies of your vet's records may be attached to provide details.

	Date Veter	rinarian	Notable Details
